

[Insert title of invention]A method for relaxing multiple constraints in search and calculation and then displaying results

Abstract

A method and process for refining a search or calculation query with multiple constraints via the Internet. The search is initiated by an end-user at a client system (Client) and received by a server system or group of server systems (Server). The Server receives the search query that includes multiple constraints. The Server then responds may to the query with data that meets these constraints or responds with a set of refined constraints for the query. The client system then presents the end user with a number of new queries that the user may use to refine their search.
